

MODEL - VIEW - CONTROLLER

... YOU WALK INTO A CAFE

You <u>request</u> a large Cappuccino

Barista is the Controller (Drinks Controller)

... BARISTA KNOWS IT'S A COFFEE BASED DRINK

Model Drink

THERE ARE MANY
INSTANCES OR
KINDS OF "DRINK" ON THE MENU

EACH DRINK...

- HAS A NAME
- HAS A RECIPE
- HAS A INGREDIENTS, ETC.

id	name	recipe
1 🖈	Cappucino	1/3 steamed milk, espresso, coccoa powder
2	Late	espresso, 2/3 steamed milk
3	Machiatto	espresso, 1/3 steamed milk
4	Americano	water, coffee

(drinks database) ... some drinks have same ingredients

BARISTA PRESENTS ...

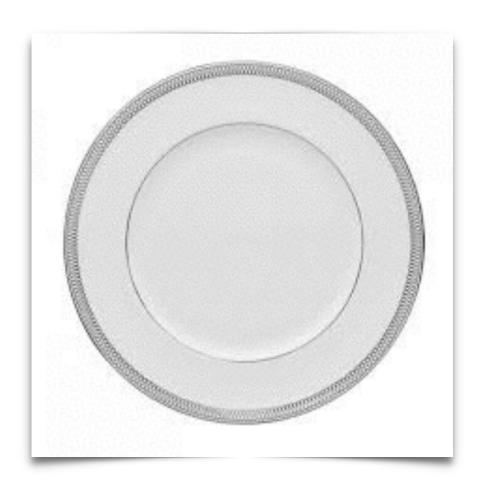

... THIS VIEW

NOTICE ... CUP IS THE "VIEW"

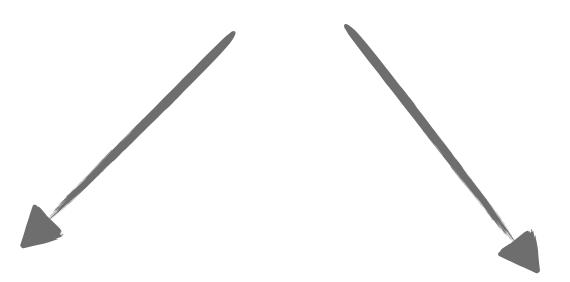

... NOT A BUCKET OR PLATE

THE BARISTA (CONTROLLER)....

INTERACTS WITH

THE "VIEW"

THE "MODEL" - DRINK

VIEW IS

THE "VIEW"

... only responsible for presentation, little logic, no computation

... only displays/renders the Model "drink"

MODEL IS WHERE

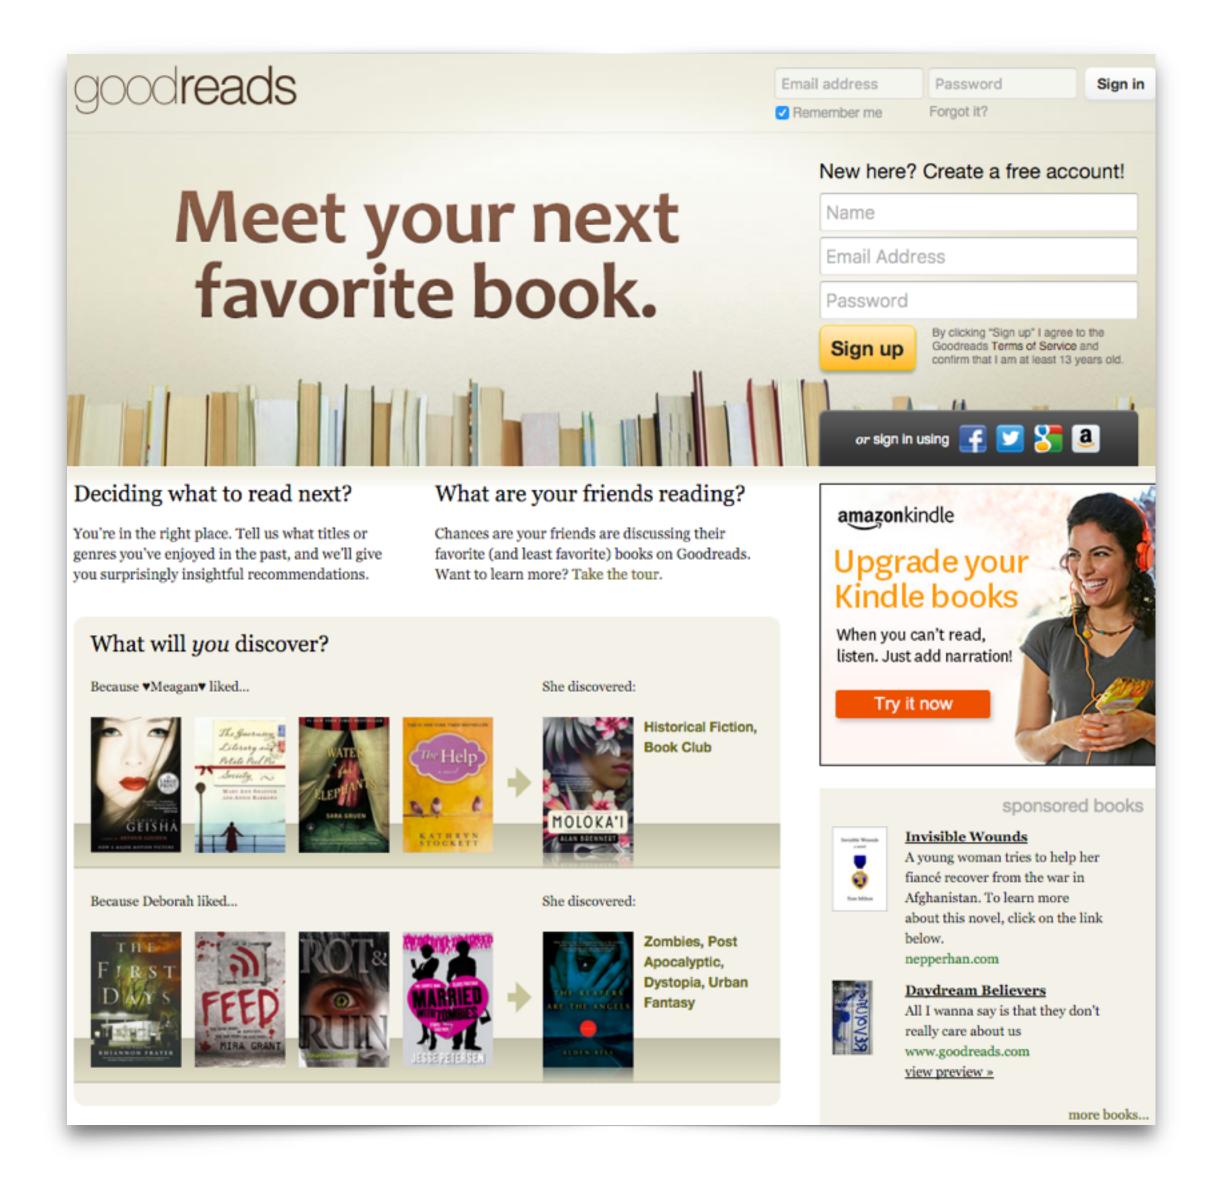

THE "MODEL" - DRINK

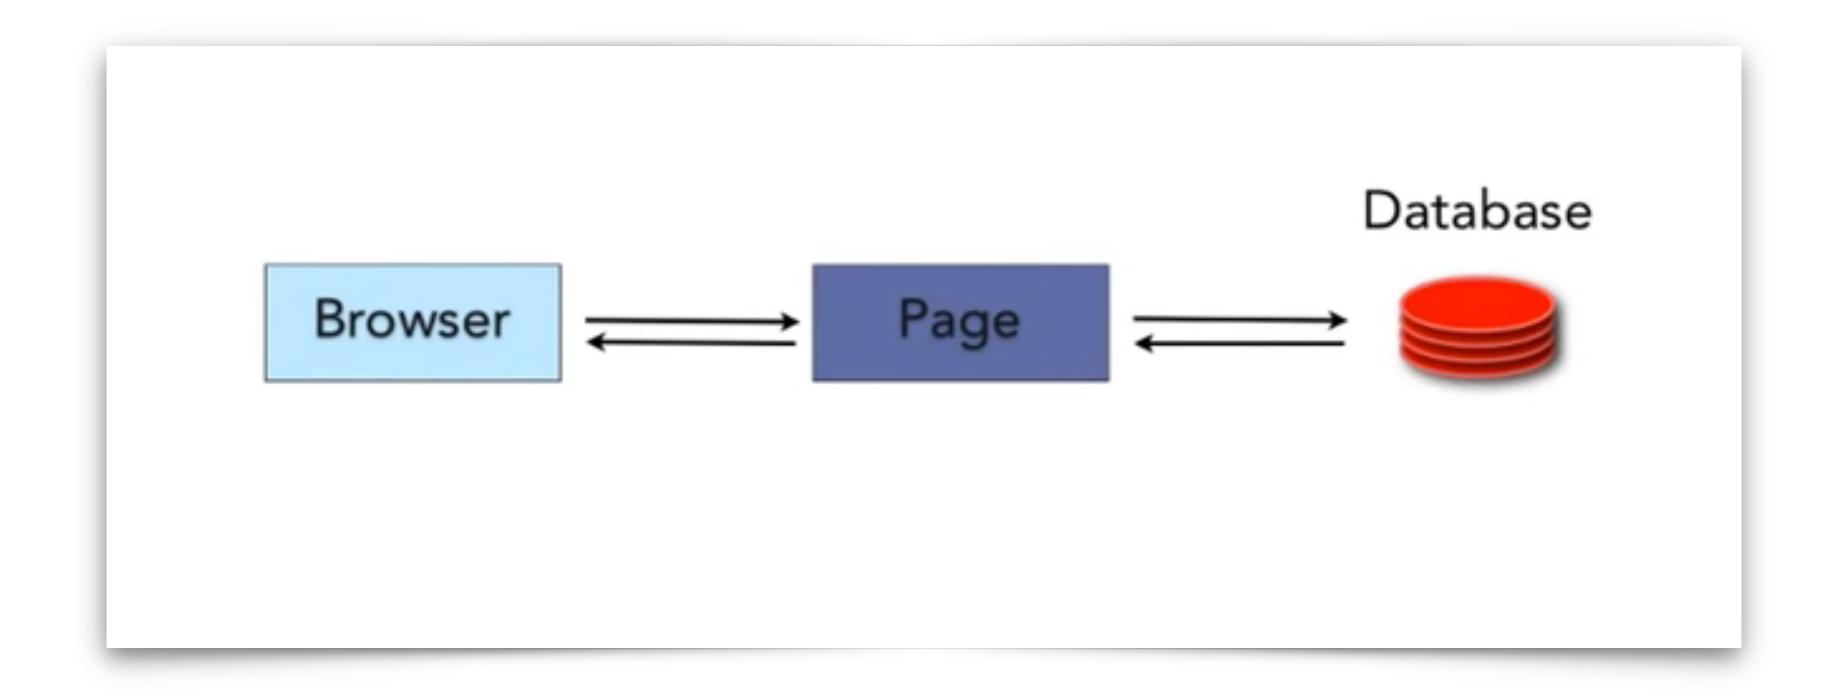

... most of the computation/logic, i.e figuring what ingredients should go with what.

... only displays/renders the Model "drink"

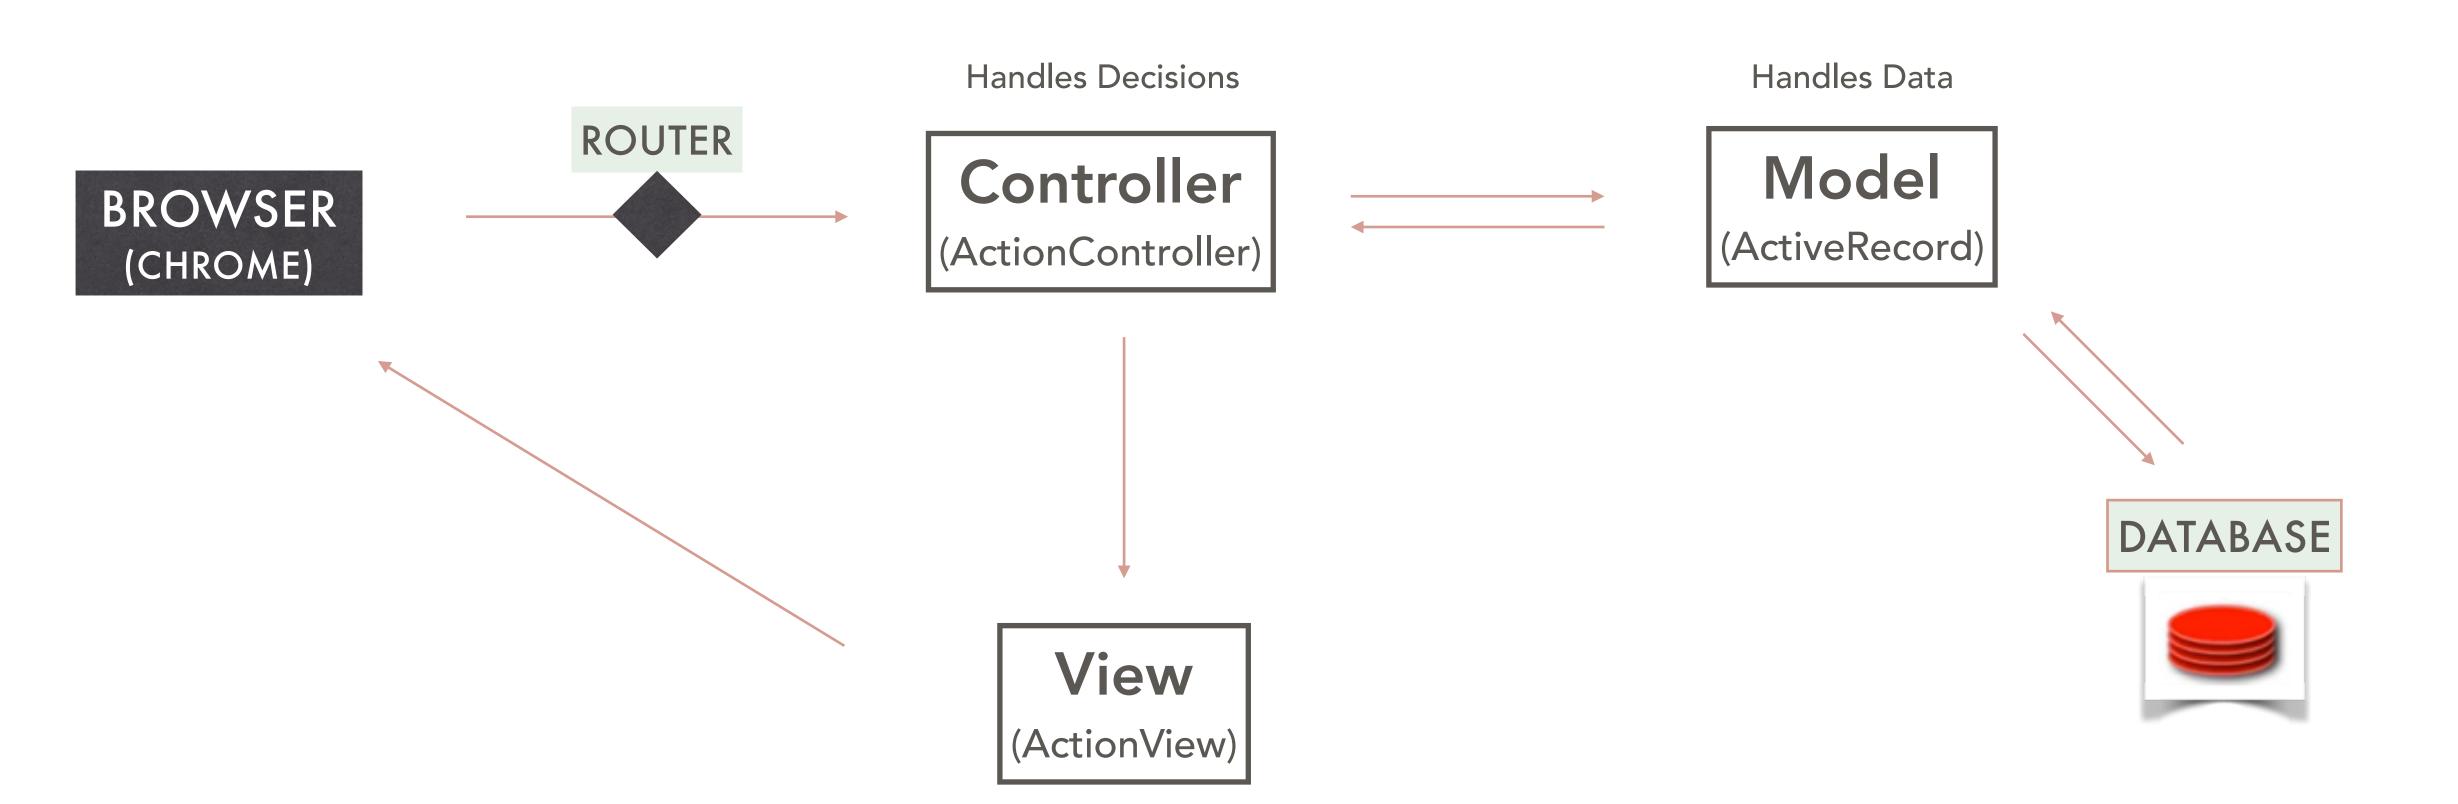

... CONSIDER A WEB APP LIKE GOODREADS

Basic Web Architecture

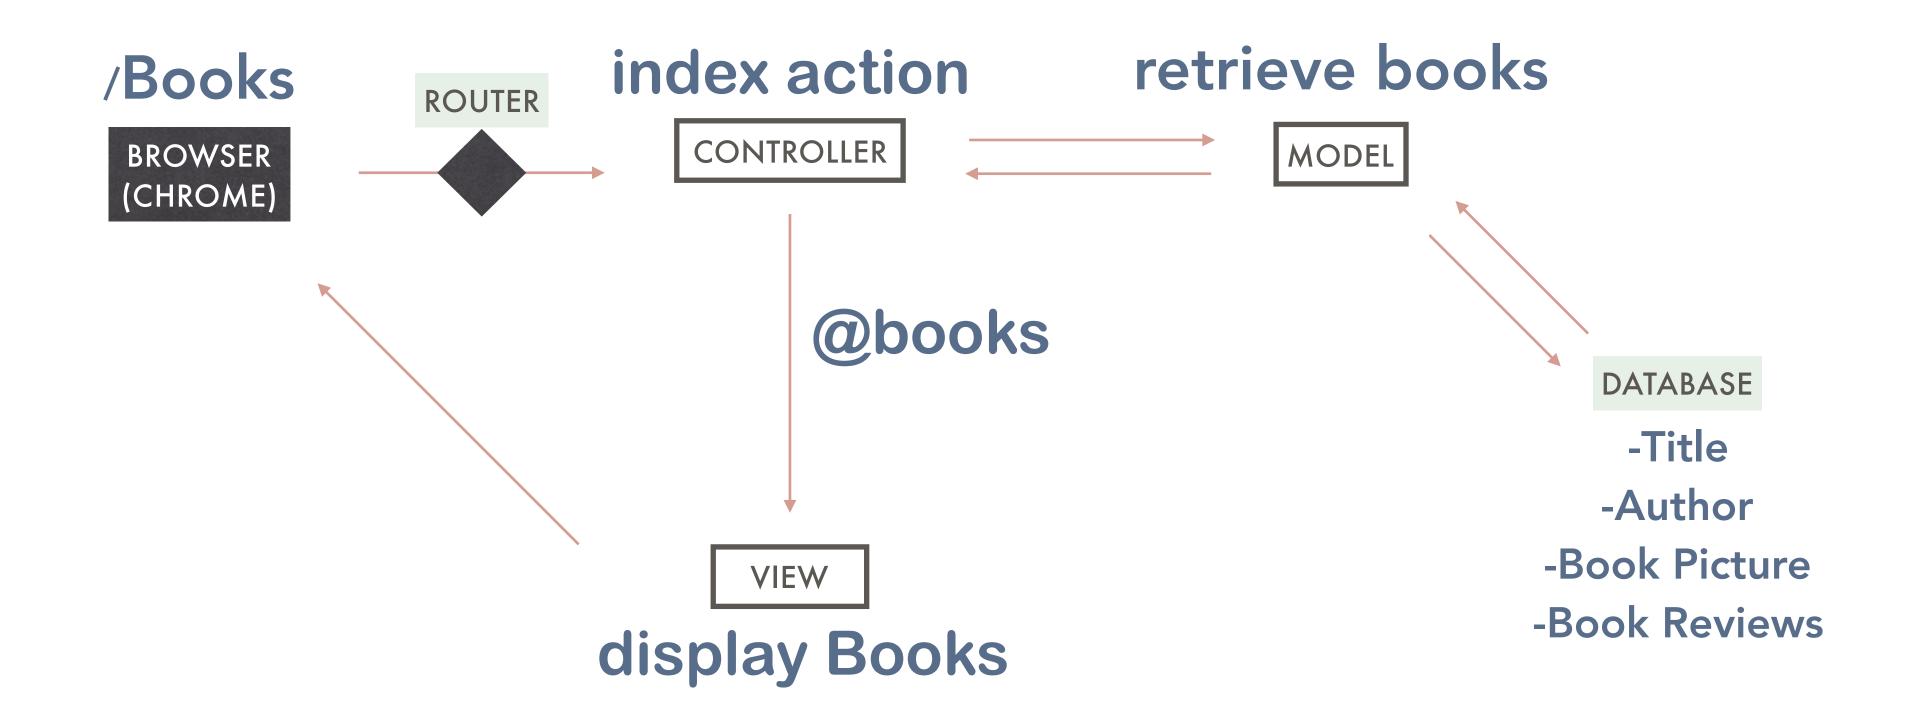

Handles Presentation

MVC

Quick Summary

- Benefits: Clear separation of interests.
- Model (ActiveRecord) handles relationships, validations, and business logic.
- View (ActionView) renders view, uses ERb (embedded Ruby) for templating (the cup is a template for all drinks)
- Controller (ActionController) Controls which view to use, makes data available as instance variables @books/@drinks. Contains several actions/defs. Controls rendering and redirection.
